## “What do you want Your Cell Site to look like?”

Case Study: The Right Choice for Attractive Cell Site Appearance

*Do you want your cell site to look like...*

**This** or **This**

**This** or **This**

**This** or **This**

When choosing a Concealment manufacturer to screen your cell site, you may want to consider what the finished product will look like in addition to performance and compliance issues. Many installations require antennas to be screened from public view and be built according to regional and local codes. The screening must also be “RF Friendly” or “RF Transparent Concealment (RFTC)” as many people describe it.

A quality fabricator must not only produce a product that meets the building codes, has low reflection and absorption properties, they must also have the ability to produce a product that, once installed, is not apparently visible to the passive observer. Consider what you want in a finished product when deciding who to fabricate your RFTC screening that will make your landlords, government inspectors and the general public content with the installation. After all, no one wants to explain why a site does not look as promised to an angry customer or city inspector, so it’s up to you to decide.
